# Summary of Findings

This report presents a deep dive into Alt Mobility's orders, customer behavior, and payment trends. The goal is to uncover what's working well, where delays are happening, and how the company can improve revenue realization, customer satisfaction, and payment reliability as it scales across India.

### 1. Operations: Strong Demand, but Sluggish Execution

Alt Mobility is seeing steady demand — with monthly order volumes ranging from 213 to 257 and average order values staying between 240 and 270. This kind of stability is great for forecasting and planning.

However, a large portion of revenue is getting stuck because of slow fulfillment:

- Orders are split fairly evenly across Pending (33.79%), Delivered (33.71%), and Shipped (32.49%), but over 66% of total revenue is tied to orders that are still incomplete.
- Monthly pending order rates hover between 28% and 36%, indicating consistent operational bottlenecks.
- A small group of customers (like Customer 7299 and 6477) have unusually high unfulfilled revenue, making them key accounts for follow-up.

Only 33.73% of revenue is from delivered orders, while 66.27% remains unrealized — highlighting the need to speed up the order-to-delivery process.

### 2. Customers: High Engagement, But Retention Can Improve

Customer engagement is strong:

- Out of 7,334 unique customers, repeat buyers have placed over 12,000 orders and contribute more than 80% of the total revenue.
- When segmented:
    - One-time buyers: 2,932
    - Repeat buyers (2–4 orders): 4,144
    - Loyal buyers (5+ orders): 258

Even though loyal customers make up only 3.5%, they generate the highest value per person.

Customer acquisition remains healthy with 39–97 new customers joining each month. However, one-time customers are more likely to have pending or shipped orders, which may discourage them from returning.

**3. Payments: High Failure Rates Are a Major Risk**

The current payment system is a weak spot:

- Payment outcomes are almost evenly divided — Pending (33.37%), Failed (33.35%), and Completed (33.27%) — which means only 1 in 3 transactions is successful.
- Payment failure rates are consistently above 30%, peaking at 36.73% in April 2025.
- Among delivered orders, only 23.76% have been paid — leaving 76% of completed revenue unpaid.
- Some high-value customers (like Customer 9598) have repeatedly failed payments, even after receiving their orders.

**4. Payment Methods: Uneven Performance Across Channels**

Not all payment methods are created equal:

- Bank transfers have the lowest success rates, often below 30%, and a failure rate of over 40% in some months.
- PayPal shows the best results, with a peak success rate of 43%.
- Credit cards are moderately reliable but still have high pending rates.

This points to broader issues in payment infrastructure or user experience that need attention.
