Summary of Findings

This report presents a comprehensive analysis of Alt Mobility's order, customer, and payment data to uncover operational bottlenecks, customer behavior trends, and revenue risks. The goal is to equip the leadership team with actionable insights that drive faster revenue realization, stronger customer relationships, and more reliable payment operations as the company scales across India.

---

1. Operations: Strong Demand, but Execution Bottlenecks

Alt Mobility enjoys a **healthy and stable order pipeline**, with monthly volumes ranging between 213 and 257 and average order values consistently within a narrow band of 240-270. This consistency enables accurate demand forecasting and efficient capacity planning.

However, execution gaps are slowing down revenue recognition:

- **Order statuses are evenly split** across Pending (33.79%), Delivered (33.71%), and Shipped (32.49%), yet **66.27% of revenue remains tied to uncompleted (pending or shipped) orders**.
- **Pending order rates are persistently high**, fluctuating between 28% and 36% each month.
- A small group of customers - such as IDs 7299 and 6477 account for **disproportionately large shares of incomplete revenue**, making them priority accounts for operational follow-up.

Revenue Breakdown by Order Completion

- Completed (Delivered): 33.73%
- Incomplete (Pending/Shipped): 66.27%

This completion gap emphasizes the urgency of streamlining the order-to-delivery cycle.

---

2. Customers: High Engagement with Retention Opportunities

The customer base demonstrates strong engagement and revenue concentration:

- **Repeat customers account for 80.36% of total revenue** - from a pool of 7,334 unique customers and over 12,000 orders.
- Segmentation shows:
  - **One-time buyers**: 2,932 customers
  - **Repeat buyers** (2-4 orders): 4,144 customers
  - **Loyal buyers** (5+ orders): 258 customers

Despite their small share (3.5%), loyal customers generate the highest per-customer value. Monthly acquisition remains healthy, with 39 to 97 new customers each month, peaking in July 2023, May 2023, and January 2024.

However, **one-time customers experience more fulfillment issues**, with slightly higher pending/shipped rates than delivered ones — indicating a need to strengthen early customer journeys to improve repeat rates.

---

3. Payments: High Failure Rates and Revenue Risk

The payment system is currently underperforming:

- Payment statuses are evenly split: Pending (33.37%), Failed (33.35%), and Completed (33.27%), which points to **low transactional reliability**.
- **Monthly failure rates remain above 30%**, with the peak reaching 36.73% in April 2025.
- **Only 23.76% of delivered orders have been paid**, meaning most completed services are not yet monetized.
- **76% of total delivered revenue remains unpaid**, creating a serious cash flow gap.

Some high-value customers (e.g., ID 9598) show repeated **failed payments even on delivered orders**, raising risk flags and pointing to either payment friction or compliance issues.

---

4. Payment Methods: Inconsistency Across Channels

An evaluation of payment methods since January 2025 revealed:

- **Bank transfers perform the worst**, with success rates often below 30% and failure rates exceeding 40% in April.
- **PayPal consistently outperforms** others, peaking at 43% success in April.
- **Credit cards show moderate performance** with lower failure rates but still significant pending transactions.

This inconsistency suggests broader problems in system integration, transaction handling, or user flows across payment methods.

Business Recommendations

1. Speed Up Order Completion

- Focus on clearing delayed orders, especially for customers who've placed large-value orders.
- Set up tracking for how long each order is taking and alert teams when orders get stuck.
- Use your stable monthly demand data to better plan inventory, delivery routes, and staffing.

---

2. Prioritize Your Most Valuable Customers

- Give faster service and priority handling to top customers who bring in the most revenue.
- Offer loyalty benefits or faster deliveries to keep repeat customers coming back.
- Set up programs that turn regular buyers into loyal customers with personalized perks or offers.

---

3. Make the First Customer Experience Better

- Make sure first-time buyers have a smooth and reliable experience — delays or confusion at this stage often lead to drop-offs.
- Keep communication clear during the first order and offer small rewards to encourage a second purchase.
- Monitor first-time customer orders closely to fix any issues quickly.

---

4. Fix Payment Issues and Make It Easier to Pay

- Review how your payment systems are working and fix bugs that are causing failures or pending payments.
- Highlight the best-performing payment methods (like PayPal and credit cards) and reduce reliance on lower-performing ones like bank transfers.
- Regularly track and share payment success rates to spot trends and improve performance.

---

5. Recover Missed Payments for Delivered Orders

- Send friendly, automated reminders when a delivery is completed but payment hasn't gone through.
- Set up a dashboard that shows all “Delivered but Unpaid” orders so teams can follow up in real time.

---

6. Keep an Eye on Risky Customers

- Identify customers who often miss payments or owe large amounts after deliveries.
- Ask for upfront payment from these customers or limit their ability to place high-value orders.
- Use order and payment history to decide which customers are reliable and which need stricter terms.
